

Chemistry Preparedness Survey

High School Chemistry Teacher Support Group

Fall 2004 – Part I Coversheet

This initial survey was designed as a 50-question (Scantron form) anonymous assessment of student background in science and math, read, writing and language skills, parental support and student expectations. It is hoped from this initial assessment that data can be tallied to determine what type of preparation incoming students to chemistry have both in personal and school support. Upon first survey teachers themselves may find this information valuable for planning throughout the year. It is hoped that teachers will then forward their survey forms for inclusion in a full study for sharing at the national level that will include a description illustrating the differences among school/state prerequisites for first year high school chemistry.
